Developing a Mental Model of Istio: From Kubernetes to Sidecars to Ambient

Aaron Birkland & Nina Polshakova

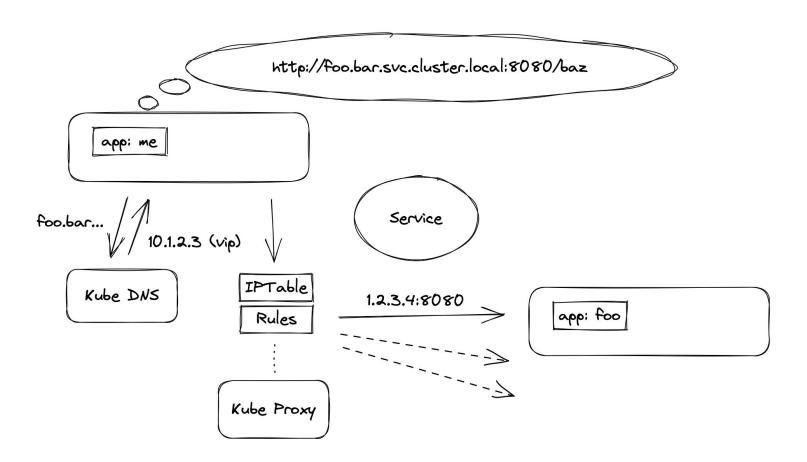

Abstractions

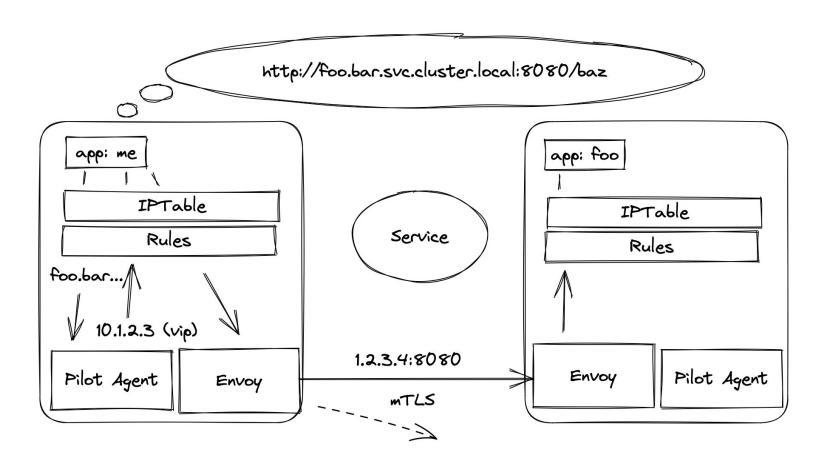

Implementing Abstractions

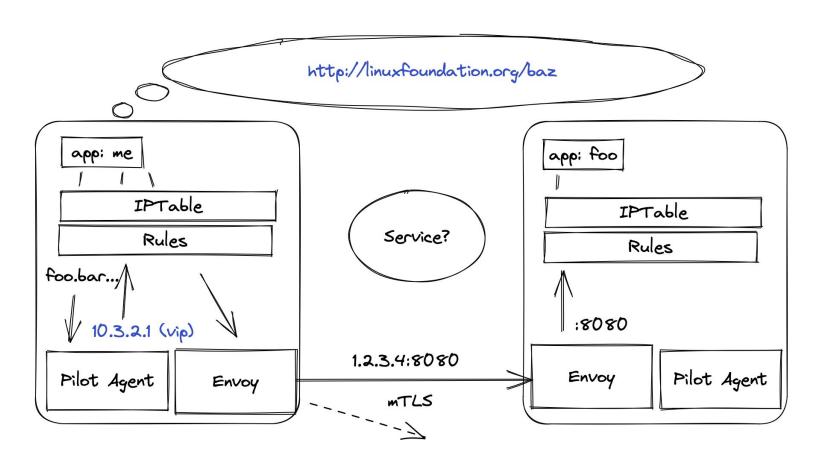

Implementing Abstractions Differently

Implementing Different Abstractions

Foundations of an Istio API

Client/Consumer sidecar

VirtualService

Policies that affect traffic routing

DestinationRule

Policies that occur after routing decisions have been made

ServiceEntry

 Explicitly describe properties of a service (DNS names, VIPs, endpoints, ports, protocols)

Server/Producer sidecar

PeerAuthentication

 Connection security (mTLS) authentication requirements

AuthorizationPolicy

Access Control

RequestAuthentication

User-space authentication requirements

Istio - Ambient Layers

L7 Layer Processing (Waypoint)

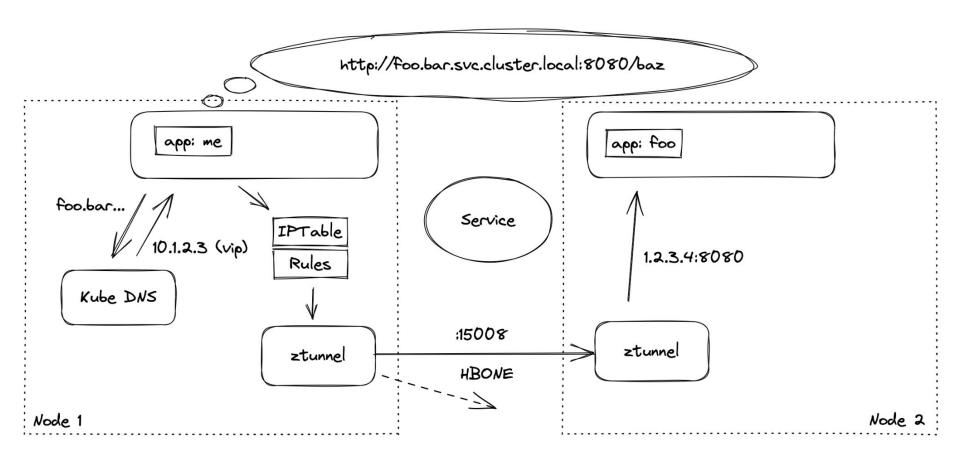

- Traffic Management: HTTP routing, header manipulation, rate limiting, fault injection, load balancing, circuit breaking, retries, timouts, etc.
- Security: L7 Authorization policies
- Observability: HTTP metrics, Access logging, tracing

Secure Overlay Layer (ztunnel)

- Traffic Management: TCP Routing
- Security: mTLS tunneling, Simple auth policy
- Observability: TCP metrics, logging

Implementing Abstractions Differently?

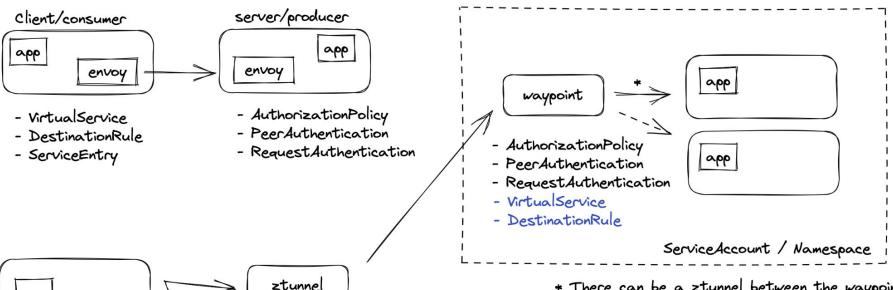

Implementing an API differently

- AuthorizationPolicy (L4)

- Service Entry (not implemented yet)

app

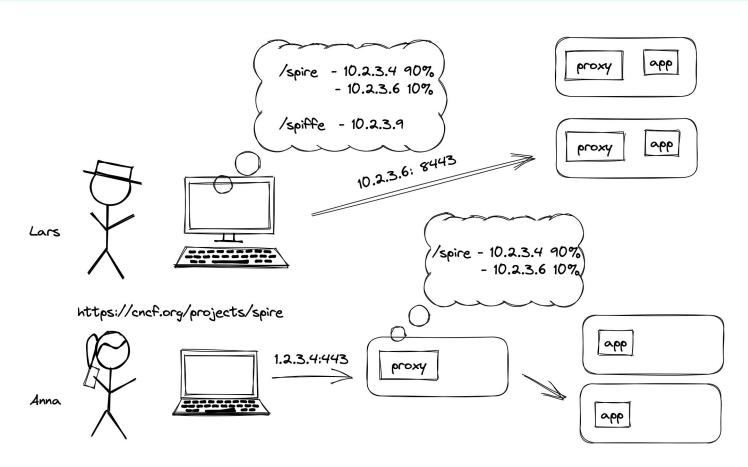

* There can be a ztunnel between the waypoint and destination pod too, in order to decrypt the traffic from the Waypoint for the pod. It does not do any load balancing or L4 authz policy in this scenario;

An analogy

Demo Time!

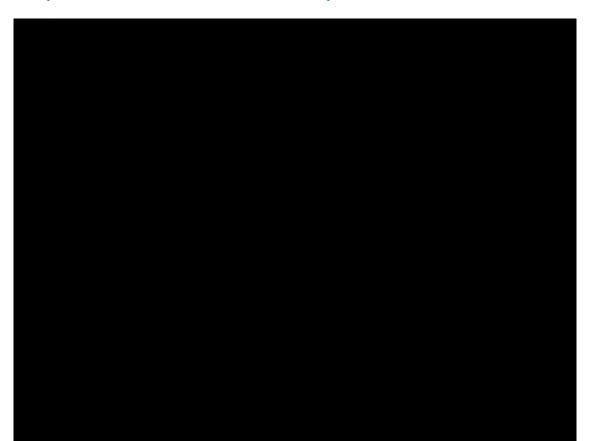

Demo

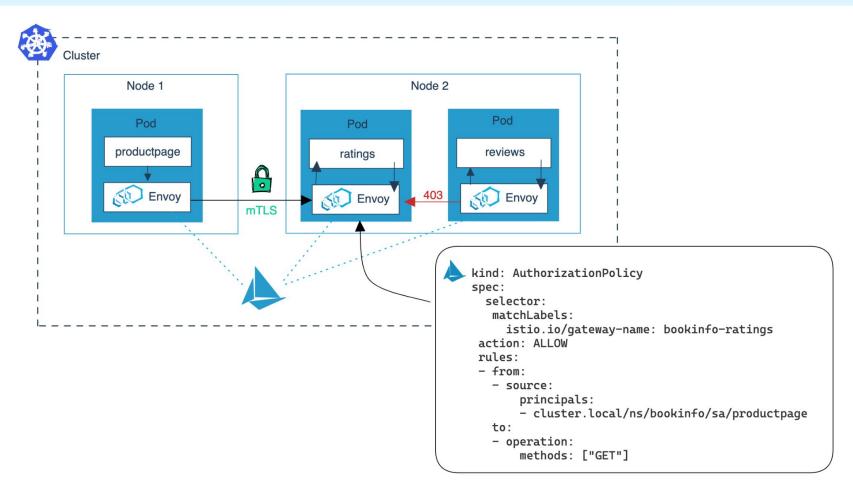

https://github.com/npolshakova/ambient-examples

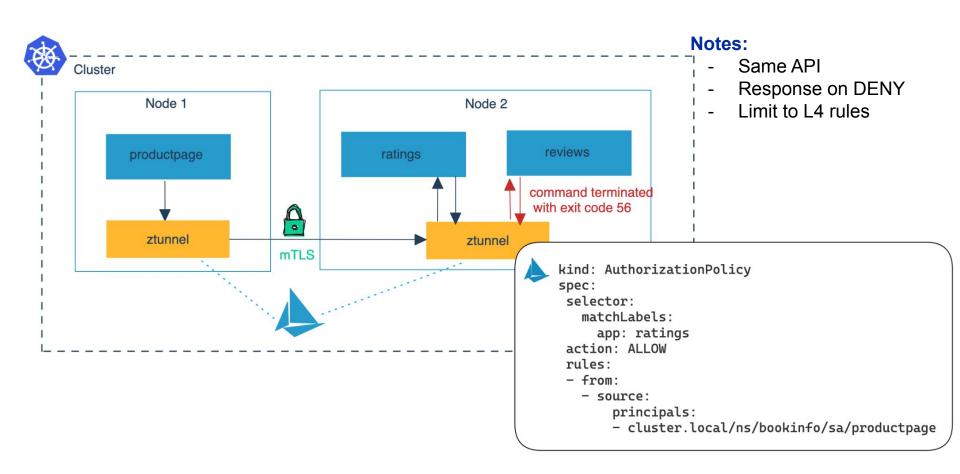

Example - Sidecar AuthorizationPolicy

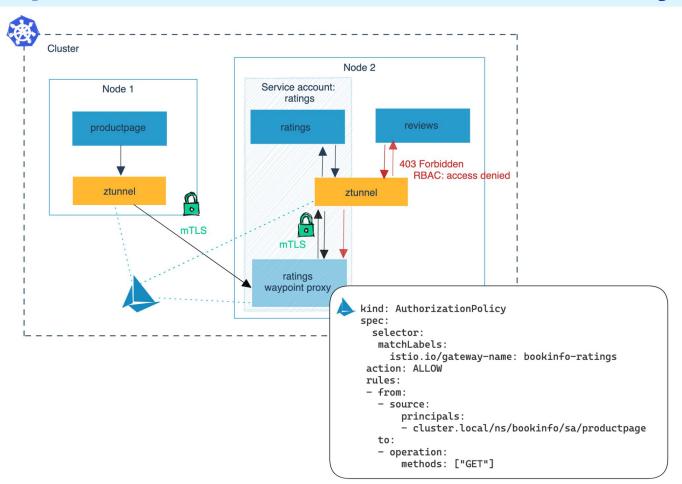

Example - Ambient L4 AuthorizationPolicy

Example - Ambient L7 AuthorizationPolicy

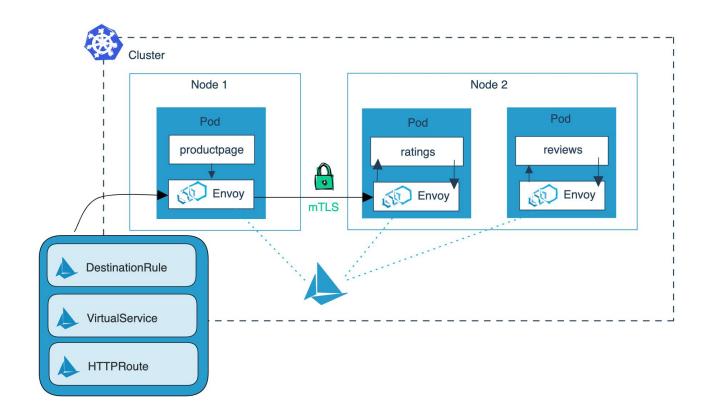

Example - Sidecar Routing

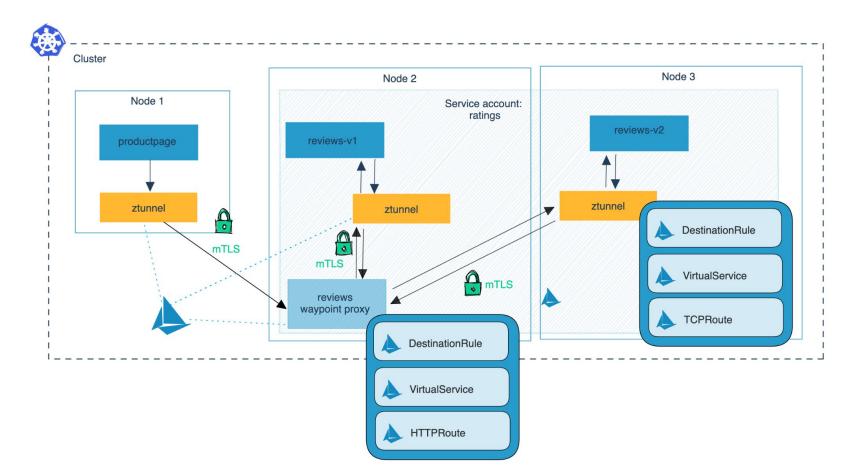

- VirtualService
 - Gateway API: HTTPRoute (L7) or TCPRoute (L4)
- Client side

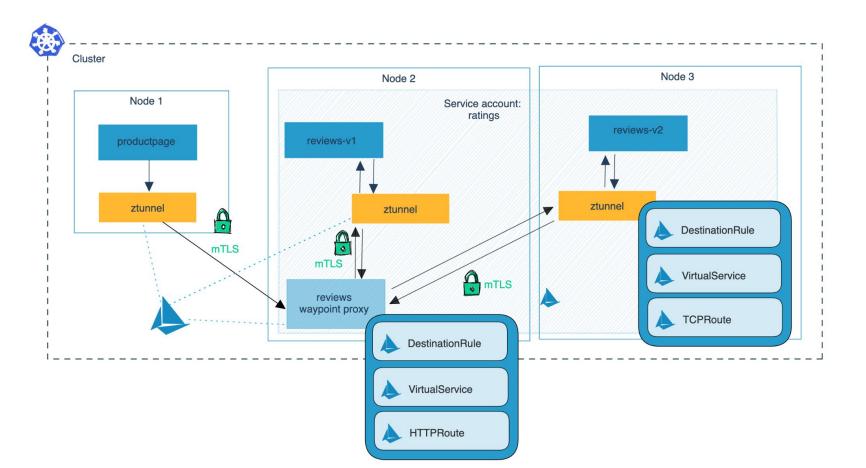

Example - Ambient Routing

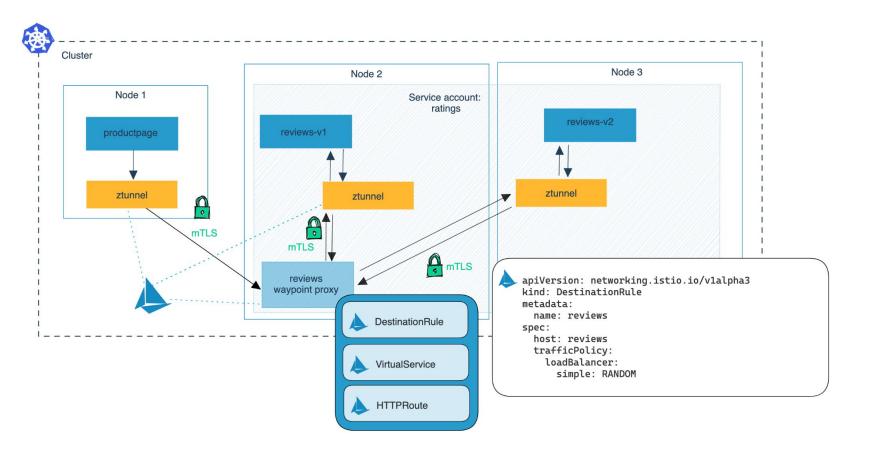

Example - Ambient Policy

Example - Ambient Traffic Shift
