

---- North America 2023

Take It to the Edge: Creating a Globally Distributed Ingress with Istio & K8gb

Jimmi Dyson, D2iQ

In the beginning there was one...

https://mysite.example.com

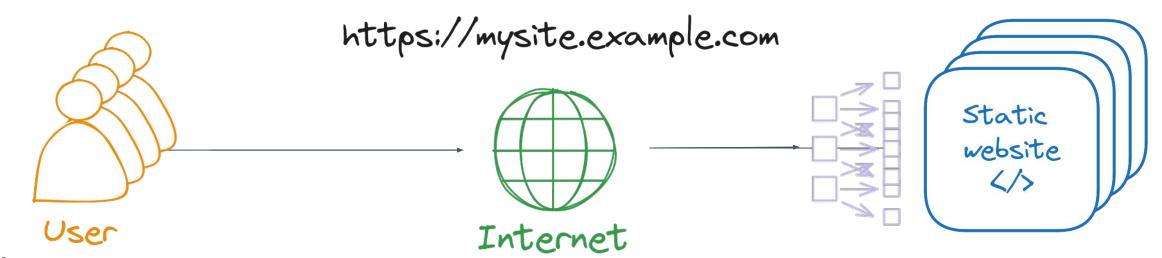

Static website </>>

\$ dig +short podinfo.example.com

10.0.0.1

But then it got popular...

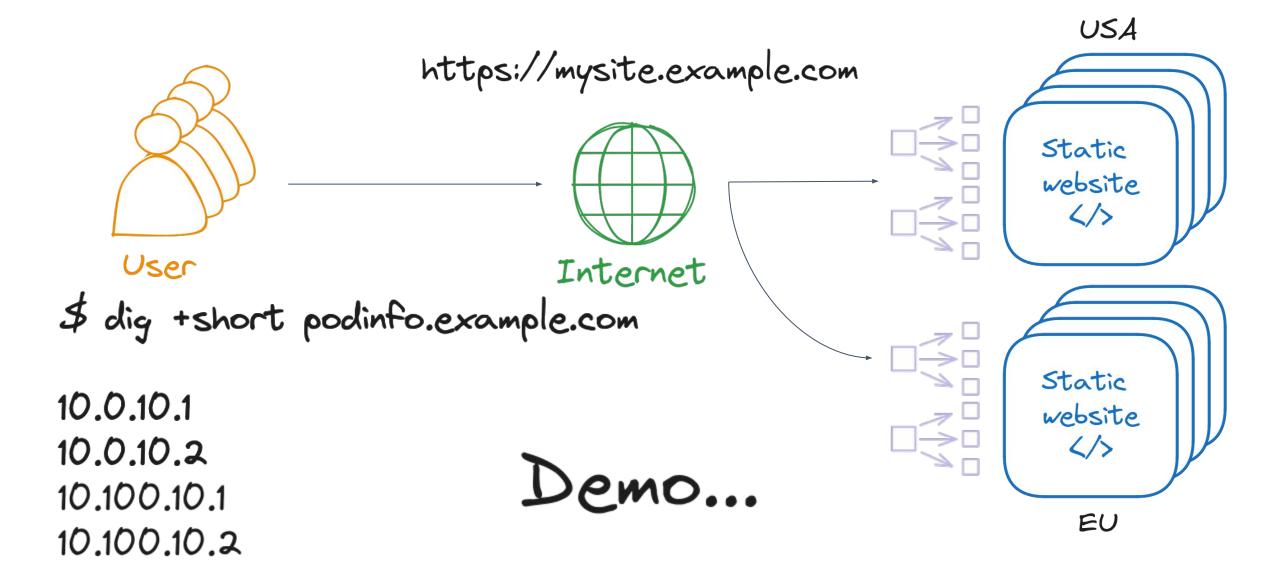

\$ dig +short podinfo.example.com

10.0.10.2

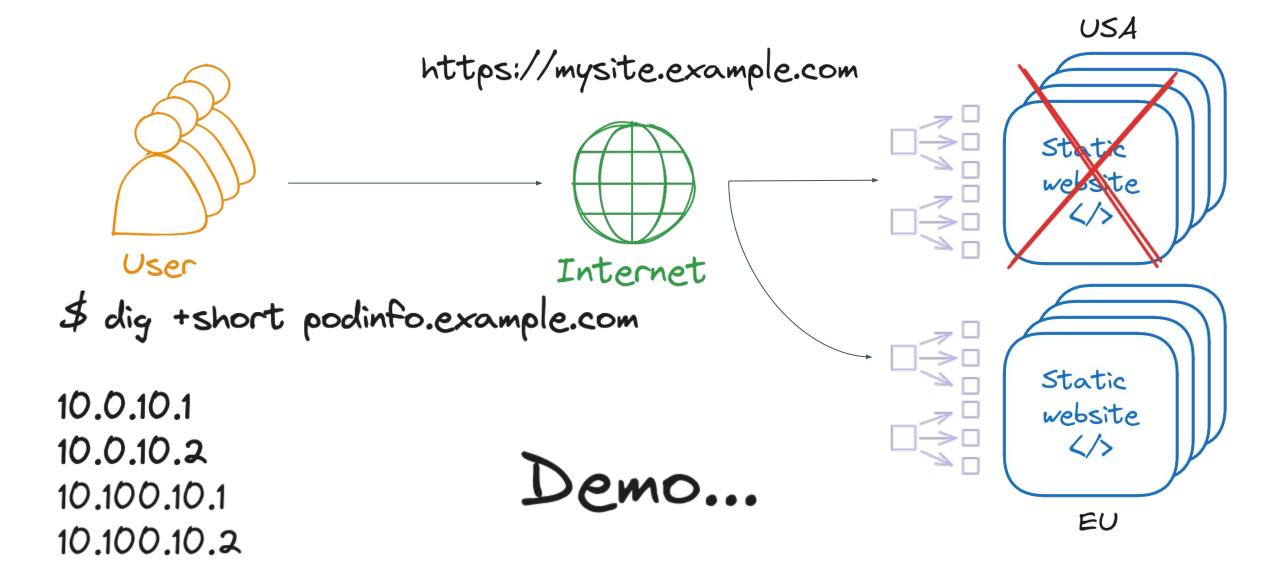

Going global!

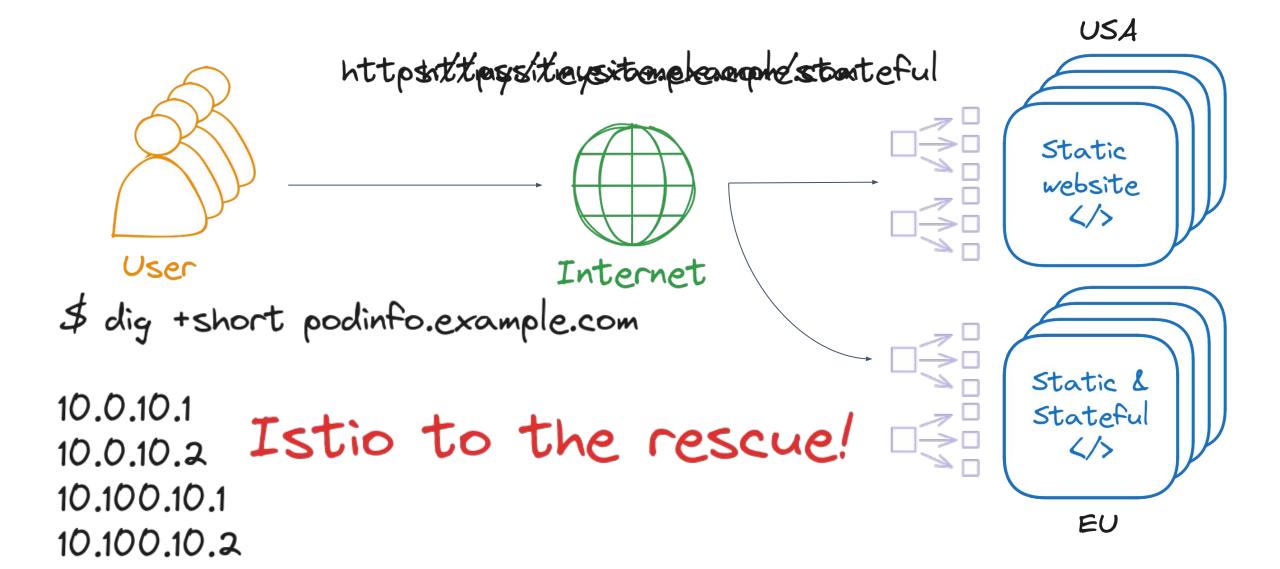

Failure! Failure!

Stateful workloads

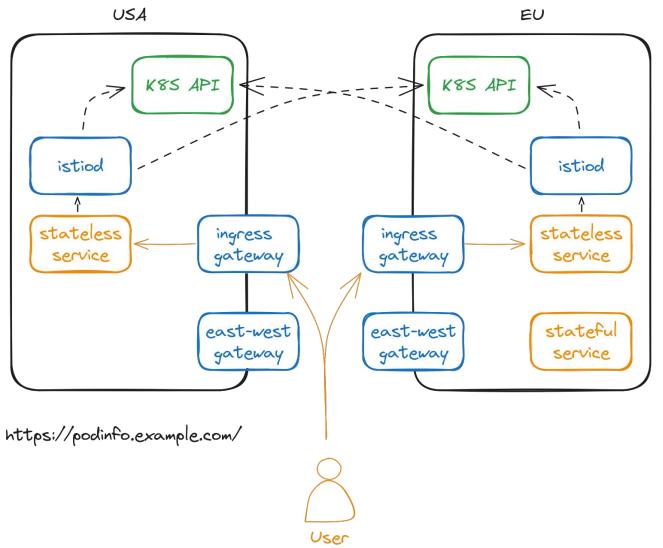

Stateless workloads

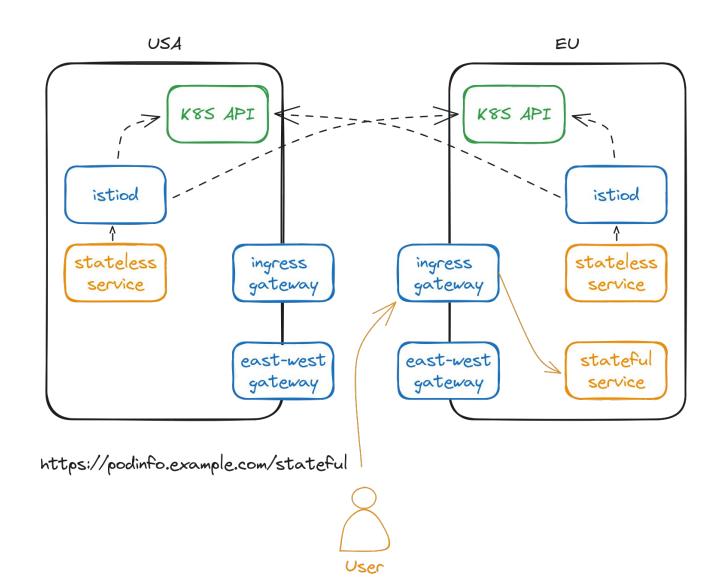

Stateful workloads via EU

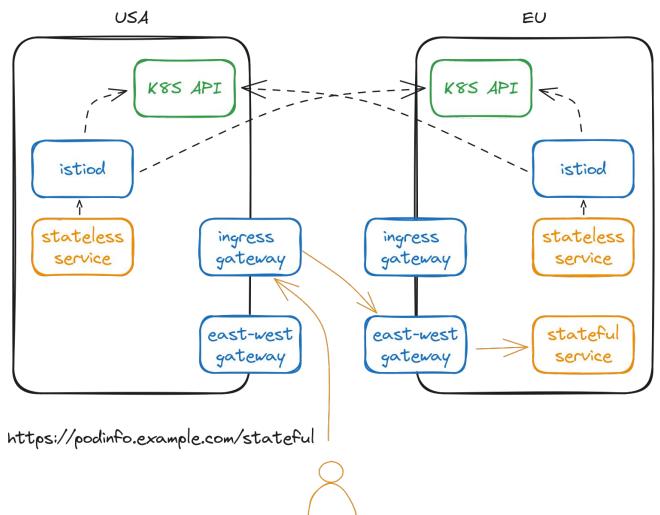

Stateful workloads via USA

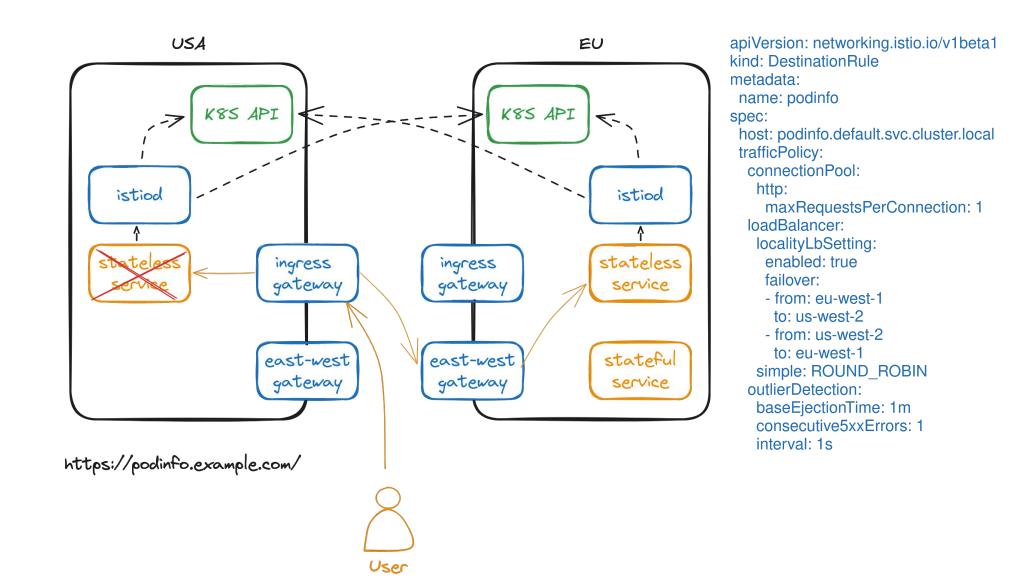

Failure! Failure!

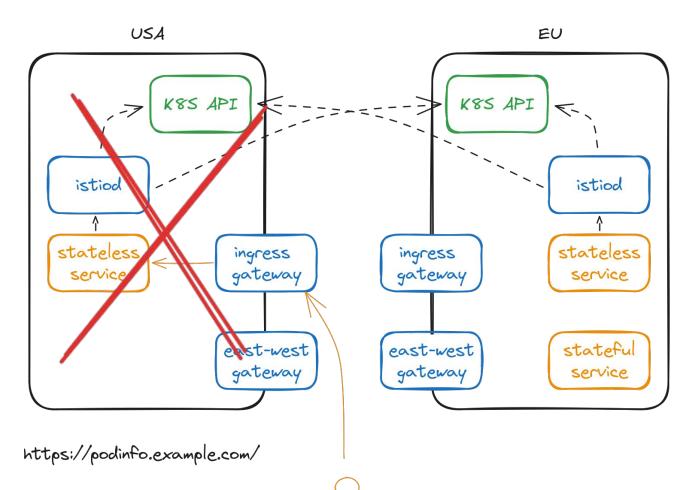

Or even worse!

North America 2023

K8gb to the rescue!

What is K8gb?

DNS Load Balancing No single point of failure Kubernetes Kubernetes KubernetæsobæltiBælbææðsh checks

Easy configuration

How does it work?

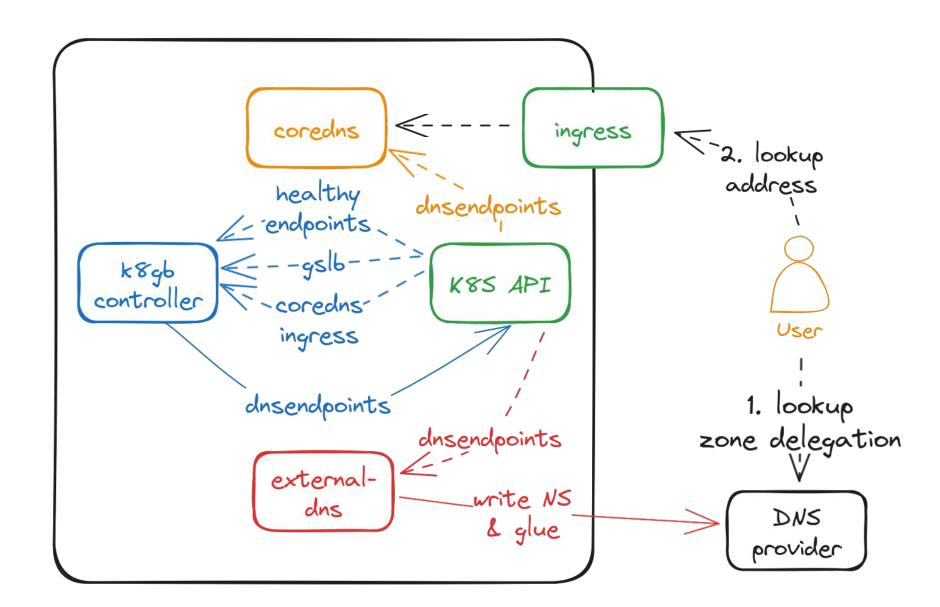

```
apiVersion: k8gb.absa.oss/v1beta1
kind: Gslb
metadata:
 name: podinfo
 namespace: default
spec:
  ingress:
    ingressClassName: istio
   rules:
     - host: podinfo.k8gb.example.com
       http:
         paths:
           - backend:
                                    or annotations
               service:
                 name: podinfo
                                       on ingress...
                 port:
                   number: 9898
             path: /
             pathType: Prefix
  strategy:
   dnsTtlSeconds: 5
    splitBrainThresholdSeconds: 60
   type: roundRobin
```

The secret sauce

North America 2023

istio
